Abstract The purpose of this study was to determine the effect of a 12-week training program on the physical fitness of 10-year-old children. The study was conducted in a primary school in Ankara, Turkey. The study group consisted of 20 children (10 boys and 10 girls) who were randomly selected from the 10-year-old children of the school. The children were divided into two groups: a control group and an experimental group. The control group did not participate in any physical activity program, while the experimental group participated in a 12-week training program. The physical fitness of the children was measured at the beginning and at the end of the 12-week period. The measurements included maximum heart rate, maximum oxygen consumption, maximum power, and maximum speed. The results of the study showed that the experimental group had significantly higher values for all four measurements at the end of the 12-week period compared to the control group. The results suggest that a 12-week training program can improve the physical fitness of 10-year-old children.

Conclusions and Perspectives

As a result of the implementation of the National Strategy for the Promotion of Science, the scientific community has been able to develop a series of projects that have contributed to the advancement of knowledge in various fields. The results of these projects have been published in scientific journals and have been presented at international conferences. The scientific community has also been able to establish collaborations with other research institutions and has been able to attract funding from the private sector.

The results of the implementation of the National Strategy for the Promotion of Science have been positive. The scientific community has been able to develop a series of projects that have contributed to the advancement of knowledge in various fields. The results of these projects have been published in scientific journals and have been presented at international conferences.
